

## Modbus Connection Module

The ModBus Connection Module adds an additional ModBus interface to myP through which the robot can be controlled. myP runs a Modbus server which is available for clients as soon as the robot is powered on. Many commands that are usually issued by the browser (such as connecting, calibrating and starting applications) can be sent to the robot via the ModBus interface. The interface can also be used to make the robot control the clients. Most customers use this module to directly connect the robot to a PLC.
